Taxonomy

Kingdom	Phylum	Class	Order	Family
Animalia	Mollusca	Gastropoda	Stylommatophora	Hygromiidae

Taxon Name: *Actinella lentiginosa* (R.T. Lowe, 1831)

Taxonomic Notes:

Wollaston (1878) described two varieties; one variety *lentiginosa* and var. *stellaris* and Bank *et al.* (2002) retain both subspecies in their Madeiran list.

Assessment Information

Red List Category & Criteria: Least Concern [ver 3.1](#)

Year Published: 2013

Date Assessed: July 9, 2010

Justification:

The species is found in many localities on Madeira and the Desertas, and does not seem to face major threats, so it is assessed as Least Concern (LC).

Geographic Range

Range Description:

This species is endemic to the Madeiran islands where it is only found on Madeira and has two subspecies, both of which are common on the island. It is mainly found in the coastal and lowland areas, rarely found inland or on the summits (Cameron and Cook 1998, Seddon 2008).

Country Occurrence:

Native: Portugal (Madeira)

Distribution Map

Actinella lentiginosa

Range

Extant (resident)

Compiled by:
IUCN

The boundaries and names shown and the designations used on this map do not imply any official endorsement, acceptance or opinion by IUCN.

Population

There are no information on populations trends, but it is believed to be stable.

Current Population Trend: Stable

Habitat and Ecology (see Appendix for additional information)

This species is found in leaf-litter and under rocks at low elevations on grassland, scrub areas as well as disturbed habitats.

Systems: Terrestrial

Use and Trade

The species is not known to be utilised, although occasionally sold by shell collectors.

Threats

The species will be locally threatened by activities which lead to habitat loss (urbanisation, road construction), however given the wide range these are not considered to threaten the species.

Conservation Actions

There are no conservation actions known for this species, and none are recommended.
