Taxon Name: *Napaeus bajamarensis* Ibanez & Alonso, 2009

Assessment Information

Red List Category & Criteria: Least Concern [ver 3.1](#)

Year Published: 2013

Date Assessed: March 25, 2011

Justification:

This species is endemic to the island of Tenerife and lives on the northern slopes of the Anaga Mountains. There are currently no threats known to this species, but the increasing urbanisation and its effect on the species should be monitored. However, this species is relatively widespread, and it is therefore considered to be Least Concern (LC).

Geographic Range

Range Description:

This species is endemic to the island of Tenerife and lives on the northern slopes of the Anaga Mountains. This species is recorded from 6 locations and 11 sites.

Population

The size and trend within the subpopulations are stable.

Current Population Trend: Stable

Habitat and Ecology (see Appendix for additional information)

This species lives in the dry temperate shrub vegetation (Piso basal), exceptionally in pine forests.

Systems: Terrestrial

Use and Trade

This species is not used.

Threats (see Appendix for additional information)

Potential threats to this species are destruction of the habitat by the increase of the urban area of Bajamar and subsequent road construction.

Conservation Actions (see Appendix for additional information)

The eastern subpopulations are under local conservation schemes.
